May 23, 2020 A: You can do it like this: Sub ReturnData() Dim x As String, s As String, Start As Date, End As Date s = Now.ToString("MM-dd-yyyy hh:mm:ss") Start = CDate("01-01-2016") End = DateAdd("m", 3, CDate("01-01-2016")) For x = Start To End Sheets("Sheet1").Range("A" & x) = s & x Next x End Sub You may have to change the values in the code to suit your needs. Aging is a highly complex biological process that is associated with a decrease in cellular homeostasis. Senescence involves two processes, one involves loss of proliferative potential and the other is generally referred to as "the Hayflick limit" where cells are said to become senescent as the number of cell divisions increases. The Hayflick limit can be extended by the addition of growth factors, hormones or by genetic changes. Examples of the latter are activation of oncogenes, down regulation of tumor suppressor genes, and changes in genes involved in telomere length. In addition, stem cell proliferation can be enhanced and maintained by a variety of soluble factors, including growth factors, cytokines and hormones. Aging of stem cells or stem cell-derived progeny is associated with a loss of self-renewal, differentiation, DNA repair and reduced function in organisms of all eukaryotes from nematodes to humans. (Ross, Aging Cell 4, 541-551 (2005)). Cancer, as a form of dis-regulation in cell proliferation, is generally associated with an increase in the level of inflammatory mediators. Additionally, chronic inflammation is a known risk factor for cancer. (Gupta, K. K., et al., Ann. Med. 34:4-6 (2002); Lin, D., et al., Lancet Oncol. 6:326-329 (2005); Hagerstrom, A., et al., Clin. Cancer Res. 11:1397-1405 (2005); Jonsson, K., et al., Am. J. Clin. Pathol. 133:68-80 (2006)). Inflammatory mediators
