A basic introduction in microbiology and parasitology, the text begins with a short section on microbial life. It also features an introductory three-chapter view on the role, physiologic mechanisms, and therapy of infections caused by viruses, bacteria, and parasites. Superficial temporal artery-middle cerebral artery bypass in the treatment of anterior cerebral artery aneurysms. The middle cerebral artery may be bypassed to prevent recurrent hemorrhage in treatment of small-sized anterior cerebral artery aneurysms (ACAAs). However, only sparse literature data support this treatment. We studied the outcome of aneurysmal obliteration of ACAAs by bypass of the middle cerebral artery (MCA) through a superficial temporal artery (STA) graft. The clinical data of all patients (n = 78) with unilateral or bilateral ACAAs treated with MCA (or MCA and superficial temporal artery) bypass during a 22-year period were evaluated retrospectively. Thirty-seven patients underwent surgery without symptoms caused by a Hunt and Hess grade I-IV stroke. Asymptomatic ruptured aneurysms were diagnosed in 10 patients. Two patients had initial seizures due to subarachnoid hemorrhage after clipping of aneurysms. In the remaining 23 patients, hemorrhagic transformation of aneurysms occurred. The size of the aneurysm ranged from 1.8 to 6.8 mm (mean, 3.2 mm). Follow-up examinations were performed in 57 of the 77 patients. The clinical outcome at follow-up was evaluated as Hunt and Hess grades I-IV. At a mean of 12.6 months, 67 of the 77 patients were followed up; 8 of them were asymptomatic. Outcome of successful surgery was excellent for 33 patients and good for 29 patients. The Hunt and Hess grade I-II outcome was obtained in 25 patients and the grade III-IV outcome in 11 patients, whereas the outcome of symptomatic patients (Hunt and Hess grade I-IV stroke) was poor in all cases. The mean time of follow-up for asymptomatic aneurysms was 20.8 months. The rates of aneurysmal obliteration and complete occlusion were 97.2% and 90.7%, respectively. The results of this study suggest that bypass of the MCA through a STA graft is an effective treatment for ACAAs. Ask HN: How do you find an affordable tech/business mentor? - 2T1Qka 3ef4e8ef8d
