Then, I got the error "Cannot find DLL file:L" So, I ran the setup again and then the software setup and then I restarted my laptop. The present invention relates to an intermediate transfer element used for electrophotography. In electrophotography, an electrostatic image formed on a photoreceptor is developed into a visible image using a toner which is a developing agent, the developed image is transferred to an intermediate transfer element by a transfer method such as a corona transfer method, and then, the image is fixed on a recording medium by heating and pressing. The intermediate transfer element has a functional layer which is formed of, for example, polyester. When the intermediate transfer element is used repeatedly for a long period of time, the functional layer is sometimes worn or peeled off, and the toner image may be blurred. Therefore, JP-A-1-100149 proposes an intermediate transfer element including a conductive resin layer formed on the surface of a substrate, as a functional layer. In the intermediate transfer element disclosed in JP-A-1-100149, the conductive resin layer has a thickness of 0.1 to 1.5  $\mu\text{m}$ , and the conductive resin layer is formed on the surface of the substrate. This conductive resin layer is not particularly disclosed, and a formed shape thereof is merely explained. The conductive resin layer is very thin compared to the substrate, and thus is substantially transparent. Therefore, when the intermediate transfer element is used for an image forming apparatus, an image is transferred to a recording medium via the transparent conductive resin layer, and thus, the image can be clearly transferred to the recording medium. In the above-mentioned intermediate transfer element, the surface of the conductive resin layer is exposed to a toner layer in a developing device. Therefore, when the conduct 2d92ce491b
