Pharmacokinetics and safety of single- and multiple-dose aripiprazole: a

---

randomized, placebo-controlled, double-blind study. Aripiprazole is a novel antipsychotic agent with a novel mode of action. The pharmacokinetic profile of aripiprazole after single and multiple doses was evaluated in a double-blind, placebo-controlled study. Patients with schizophrenia, schizoaffective, or bipolar disorder were randomly assigned to receive a single dose (10 mg or 20 mg) of aripiprazole or placebo. Blood samples for measurement of aripiprazole concentrations were obtained for 24 hours. In a double-blind, crossover study, patients received multiple oral doses of aripiprazole, 10 mg twice daily for 3 days and then 20 mg twice daily for 3 days.

Steady-state pharmacokinetics of aripiprazole after multiple dosing were assessed. Forty-two patients (21, 10, and 11 in the single-dose 10-mg, single-dose 20-mg, and multiple-dose 10-mg treatment groups, respectively) were enrolled. Steady-state concentrations of aripiprazole were detectable in plasma for up to 48 hours after
