TEPP Engineering Series Vol. 11, 1989 Apr. Introduction of technological innovation in process industry has led to significant increases in plant and processing capacity. However, the process engineering has to be achieved by using process process control methods and technologies, in order to make the potential of technology effectively match the ever changing needs of industry. The Fundamentals of Process Control. - Prentice Hall - JMB Hrs Process engineers rely on Process Control to carry out process operations. Process control is an integral part of any process. Process control can be in the form of automatic control for process automation, computer control for process monitoring and process supervision or manual control for process monitoring and supervision. The objectives of process control are to ensure that.

A system-engineering approach to process design and control for process industries. The definition of process control is set out in FIECE n ISO 5452 (2000): A process is a set of activities directed to the production, processing or conversion of a product or a service. It may be viewed as a system with a controlled environment. The goals of process control are to ensure that all the plant is operated within desired limits. This is done by monitoring the process and controlling the plant. The primary methods used for monitoring and controlling the process are shown in Figure 12-2, Pressure/p HSS, and set point. These methods are used in conjunction with a control system. The control system uses feedback from the process to.
