A method for the determination of L-Trp in rat plasma by HPLC-MS-MS has been developed. The addition of alpha-MSH, a metabolite of L-Trp, to plasma and to a physiological buffer to investigate the metabolism of L-Trp in rats was also described. L-Trp was incubated with rat plasma in the presence of alpha-MSH for 15 min at 37 degrees C and the resultant metabolites were then extracted by liquid-liquid extraction. L-Trp was detected using positive ion electrospray ionization with multiple reaction monitoring. The method was applied to investigate the bioavailability and metabolism of L-Trp in rats. The results showed that a high concentration of L-Trp was metabolized by rat plasma, and the majority of the metabolites were excreted in the urine.Q: Kadison-Kubo theorem and its applications in quantum field theory Does anybody know an application of the kadison-kubo theorem (I am quite sure the theorem itself is not widely known) in QFT? A: I would like to emphasize a nice application of the Kadison-Kubo's theorem in the proof of Schwinger term in QED. One can prove the Schwinger term is zero using the summation formula for the diagrams corresponding to the closed time path. That's, in the Klein-Gordon theory, there are not any diagrams with two closed time paths, even if there are two different operators corresponding to the points where the two paths meet. However, in the case of QED, this is not true, and there are two distinct contributions: the real photon exchange and the 1d6a3396d6
