Getting your feet wet After downloading and installing Photoshop, create a new document to experiment. Try some of the following guidelines

to get yourself going: * **Create some simple layers:** * You can start with a background layer. Use the Rectangular Marquee tool to select a square on your background and drag it up or down to create a new layer. Click the New Layer icon to create a new layer. Then go ahead and make some effects on that layer. Try some of the effects that are available in the Effects panel, shown in Figure 9-1. *

Enhance your photo: * The

Photoshop toolbox contains several tools that you can apply to your photos, such as ones for making changes to the brightness or color of the photo. You can make a new layer and apply a filter to the layer. You can also enhance the detail of an image using tools that let you push and pull out the details. Figure 9-2 shows the Enhance Details tool, available in the Layers palette. This tool lets you drag the curve upward and downward and

makes the image darker or lighter. You can also apply one of the other filters from the Effects panel. FIGURE 9-1: Click the Adjustment icon to access the Effects panel. The toolbox also contains some useful tools for cleaning up your photos. Use the Spot Healing Brush to remove blemishes from an image.

A case of oculocutaneous albinism Type 1 caused by a (Tyr550Asn) mutation in the tyrosinase gene. A novel mutation (Tyr550Asn) was identified in the tyrosinase gene in a 3-year-old girl suffering from albinism Type 1. The mutation was confirmed by direct sequencing of polymerase chain reaction (PCR) products amplified with primer sets and

was seen in both leukocytes and cultured skin fibroblasts. The mutations, which are both introduced as a point mutation, have been reported as a missense and a splicing defect in previous studies. Because the splicing defect leads to mRNA degradation, the phenotype of the patient was probably less severe than those who have only the missense mutation. Promoted Cross-Au(I)-Au(I)

Intramolecular Hetero Diels-Alder Reaction To Prepare Phosphorescent and Dioxaphospherands.
Phosphorescent and dioxaphospherands were successfully prepared from the Lewis acid promoted cross-Au(I)-Au(I) intramolecular hetero Diels-Alder reaction between arylboronic acids and N-arylphosphoramidites.
Mechanistic investigations revealed that the addition of

PMe₃ during the addition of an arylboronic acid to N-arylphosphoramidite affords the corresponding arylpalladium intermediate. After the irreversible decomposition of PMe₃, the palladium intermediate undergoes an intramolecular hetero Diels-Alder reaction to form the dioxaphosphorane. Q: How to analyze memory leak in Java 1.5 It seems like I get so many memory leak issue in my projects, and it's very difficult to identify the reason. I used to debug this by "enable Garbage Collection" in Eclipse and check the "Use Parallel GC" and "Check object which occupy

memory a long time". But recently I met a project which even I use "Continue System.gc()" doesn't release the memory, even after 3 hours. I got the memory leak issue even I use the Angular JAR version with latest Java version. So my question is how can I debug this kind of problem? UPDATE: As some people suggest that using Debugger, that's not easy to use but could be possible. So now I try to use JVisualVM, seems like

it's not promising, because I find that the use of "Disable Template" in JVM produce so many exception, and many Java Class/Memory Code, especially by using iBatis, Spring and JPA have a lot of template. Thanks!

A: I saw in the GUI of the eclipse, we can set the memory to exceed the heap size, that can help us to see the memory leak. It seems that the memory cannot be exceeded in your case. So the memory leak must exist. I found

a way to test this kind of memory leak, by using MAT. Here I use this way to detect the stack leak. If the JVM didn't crashed, when I use stack-trace more than 200, I can guess that there might be memory leak. A: Assuming you're looking at a Heap, you can get a heap dump at any time using the heap dump generator (not the regular heap dump generator). Doing a heap dump is easy, just do java
`-Xmx256m -XX:+HeapDumpOn`

OutOfMemoryError -XX:HeapDumpPath=/path/to/heapdump
java_command If you want to look at the dump later, you can use `grep -B100` for a more precise search or you can use the `toString()` output of the heap dump to do fuzzy searching with a text editor. An easy way to do this is using the `log4`
